Applied Data Science Project

L14 - Slides

**Politecnico
di Torino**

e l i s
European Laboratory for Learning and Intelligent Systems

Pillars

Design

Manage

Develop

Communicate

Project communication

- Keep a **scientific mindset** when communicate: a project of **Applied Data Science** is about **Science and Technology**
- Start from an objective, pose a research question, propose a methodology, show that it has been tested in a controlled environment and analyse the results
- The same story, but different narratives according to the audience: scientists, innovators, or general public

Formats

- Slides with plots, charts, and tables
- Reports (deliverables and papers) with plots, charts, and tables
- Visuals and videos

Formats

- Slides with plots, charts, and tables
- Reports (deliverables and papers) with plots, charts, and tables
- Visuals and videos

With a scientific mindset – topic of this lecture

Plots, charts, and tables are complementary tools

- Slides **with** plots, charts, and tables
- Reports (deliverables and papers) with plots, charts, and tables
- Visuals and videos

does it mean that plots, charts and tables are complementary and cannot come along?

Yes, better to put them into a context by either providing a graphical illustration

Slide outline

Objective

Why is the project conducted?

Who are the stakeholders/beneficiaries?

How will the beneficiaries benefit from the objective?

How do you plan to reach the objectives (timeline, tasks) – usually presentation at an early stage

Can the **project** be **linked** to one of the United Nations Sustainable Development Goals?

Usually, this is one slide to set the scene and give an idea of what you're proposing for whom

Hypotheses and research questions

A hypothesis is written as a statement

A research question is written as a question

They differ in the writing style, but they are utilized interchangeably to set the challenge being addressed in the project

For instance:

RQ: Would language model contribute to have language translator?

H: Language models will improve language translator quality

Usually, this is in 1 slide, and you can put a diagram/picture to summarize the challenge

Method

When we refer to a method in a Data Science project we refer to:

- Algorithm, Model, Architecture
- Tools utilized for the implementation

Short summary of how the method achieves the previous steps

Prefer utilizing diagrams for describing a method

Usually, this is the bulk of the presentation, and you may dedicate 2 slides to the algorithm, model or architecture and 1 to summarize the utilized tools

Experiment

It reports the controlled experiment to validate the method to address the objectives defined in the project

It reports:

- dataset
- experiment configuration
- quality assessment

Usually, we have 1 slide for the dataset, 1 slide for the experiment configuration and 2 slides for the quality assessment

It is important to report tables of the quality assessment and illustrate the overall assessment task

Conclusions

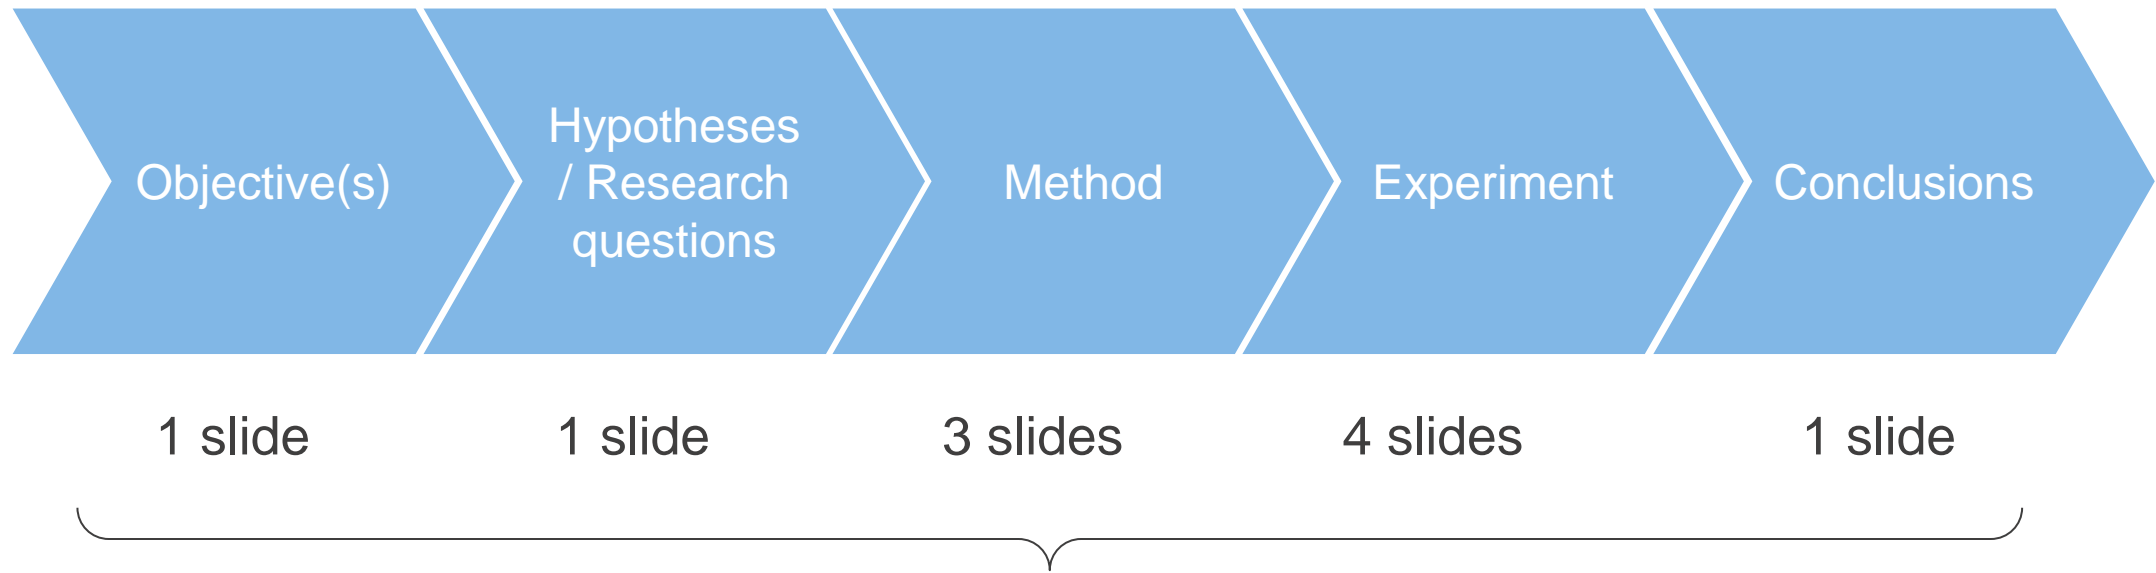

State the objective (1 sentence)

State the method (1 sentence)

State why the method is effective to reach the objective (1 sentence)

Usually this is 1-slide content that you can decide to leave for the QA session to guide the attendees to think deeper on the content and eventually pose questions

Overall

There is an additional slide for landing and another with your/team references at the end

Slide aesthetic

Aesthetic plays a little role in communication, better to take this into account

Start from a slide template that you either took from your employer, university, or that you edited yourself

Once picked, do not touch it anymore, and keep it consistent throughout the entire presentation

If it's science, can I add code?

Depends on the target

If you're sharing your experience with **developers**, then you might want to utilize some **snippets** of code in dedicated slides

If your audience is **people** who attend **TED Talk** style events, then **not at all**

Length

It depends on the target audience

General rule of thumb: 1 slide requires around 1 minute for presenting

15 minutes is a reasonable slot to have people awake during presentation (unless you like having people sleeping during your presentation)

15 minutes =~ 15 slides including both landing slide and a slides with references

Quality checkpoints before sealing your presentation

- Does it make sense to me in the first place?
- Would make sense to the reader with a given background? The background of the expected audience?
- Are there any ambiguous terms, acronyms, definitions?
- Are there any statements and arguments not supported by data either collected or computed?
- Are there any lengthy and verbose arguments?
- Are the main concepts illustrated with diagrams and charts?
- Are the results being presented with tables and or charts?

App for editing

Powerpoint

Google Slides

Both applications allow to collaborative edit the making of a presentation

Consider to export your presentation when complete to PDF to maximize the portability

Presentation and ADSP checkpoints

Will have 3 checkpoints and one final presentation at the exam

1° checkpoint: objective, research question, GANTT and task definition, conclusion

2° checkpoint: objective, research question, methodology, conclusion

3° checkpoint and exam: objective, research question, methodology, experiments, conclusion

Thank you for your attention.

Questions?
